

Retention under degradation — the level that needs no null model

Share of items still answered correctly end-to-end after degradation, among the items the same utterance / ASR / router triple answered correctly on clean audio and whose degraded transcript carries WER > 0 — §8's paired subset, 89 to 230 of the 416 utterances per cell. No null model, no fitted curve, nothing assumed. Blue, solid-to-dotted: spectrally distinct from speech. Orange: spectrally confusable with speech.
