

Absorption gain against the router's own clean WER-to-EES curve

Each cell is 416 utterances. Numbers are percentage points of end-to-end success. Outlined and hatched cells are the only ones whose 95% bootstrap interval (B = 2000, resampled by utterance, the logistic curve refit inside every replicate) excludes zero — 21 of 162, every one of them negative, and hatched left-leaning for that sign. The assumed 1 – WER comparator is not drawn here; fig3 is where the two are compared, and why.

Qwen3.5-9B (MLX 8-bit) — 0 of 54 cells positive with a 95% interval excluding zero · 6 negative · 48 covering zero

Qwen3.5-27B (GPTQ-Int4) — 0 of 54 cells positive with a 95% interval excluding zero · 8 negative · 46 covering zero

Gemma-4-31B-it (QAT w4a16) — 0 of 54 cells positive with a 95% interval excluding zero · 7 negative · 47 covering zero
